STQA PRACTICAL 4
DEFECT REPORT — GMAIL LOGIN PAGE

Software Testing and Quality Assurance

1. Objective

To prepare a defect report documenting a possible functional issue in a web application's login module, including reproduction steps, expected and actual results, severity, and priority.

2. Defect Summary

Field	Details
Project Name	Gmail Login Page
Defect ID	DEF001
Defect Title	Error message not displayed for invalid email
Module	Login Module
Reported By	Tester
Date	13 October 2026
Severity	Medium
Priority	High
Environment	Google Chrome on macOS
Defect Type	Functional Defect (illustrative)
Status	Open (sample status)

3. Defect Description

When a user enters an invalid email address (for example, abc123) on the login page and selects Next, the application is expected to show a clear validation message. The defect described in this report is hypothetical and should be treated as an actual defect only if reproduced during testing.

4. Steps to Reproduce

1. Open the Gmail login page.
2. Enter an invalid email address, such as abc123.
3. Click the Next button.
4. Observe the response displayed by the application.

5. Expected Result

The application should display an appropriate validation message explaining that the email address is invalid.

6. Actual Result

Sample defect: The appropriate validation message is not displayed. Record this as the actual result only if confirmed during execution.

7. Test Data

Input Type	Value
Invalid email	abc123
Example of valid email format	student@gmail.com

8. Recommendation

Display a clear validation message when the user enters an invalid email address, and ensure the message is accessible and understandable.

9. Conclusion

A defect report records software issues in a structured format and helps developers reproduce, investigate, and resolve them. After a fix is applied, the tester should retest the same steps and perform regression testing where appropriate.

Note: This is an illustrative academic report. The defect, status, and outcomes are examples, not verified claims about Gmail.
